### Board of Studies: Notes from the Marking Centre

Most candidates successfully demonstrated knowledge of differentiation and stationary points. However, poor algebraic skills in expansion, factorisation and substitution were evident.

- This part was done well. Common errors included finding  $f(0)$ , discovering an extra solution and attempts at expanding and refactorising.
- Almost all candidates knew to differentiate and solve  $f'(x) = 0$ , but many made algebraic errors. Candidates are reminded of a number of points:
  - substitute into the given function to find  $y$  values
  - the test being used should be clearly indicated and a conclusion drawn about the stationary point
  - when using the first derivative test it is advisable to use a table, which must be clearly labelled
  - $f''(x) = 0$  is a necessary but not sufficient condition for a point of inflexion.

- (iii) The graph caused no problem to candidates who had successfully completed part (ii). Some, however, did not continue their graph far enough to show the  $x$ -intercept of 3. Others found points of inflexion when the question did not require this. Algebraic errors meant that it was often impossible to draw a curve to fit the candidate's stationary points. Candidates are reminded that the graph of a cubic function is continuous and smooth. Care should be taken with curve sketching and graphs should be large, neat and roughly to scale.
- (iv) In the better responses candidates stated the general principle for a curve to be concave down and then solved the inequality. A number of candidates could not correctly solve  $6x + 6 < 0$ .
