**2016 13** Consider the function  $y = 4x^3 - x^4$ .

- a** (i) Find the two stationary points and determine their nature. **4**  
 (ii) Sketch the graph of the function, clearly showing the stationary points and the  $x$  and  $y$  intercepts. **2**

$$\begin{aligned} \text{(i)} \quad y &= 4x^3 - x^4 \\ y' &= 12x^2 - 4x^3 = 0 \\ 4x^2(3 - x) &= 0 \\ x &= 0 \text{ or } 3 \end{aligned}$$

$$\begin{aligned} y(0) &= 4(0)^3 - (0)^4 \\ &= 0 \end{aligned}$$

$$\begin{aligned} y(3) &= 4(3)^3 - (3)^4 \\ &= 27 \end{aligned}$$

$\therefore$  stationary points at  $(0, 0)$  and  $(3, 27)$ .

$$\begin{aligned} y'' &= 24x - 12x^2 \\ y''(0) &= 24(0) - 12(0)^2 = 0 \end{aligned}$$

$\therefore$  possible horizontal point of inflexion.

Now, consider the slope of curve near  $x = 0$ :

$x$	-1	0	1
$y'$	$>0$	0	$>0$

$\therefore$  horizontal point of inflexion at  $(0, 0)$ .

$$\text{Also, } y''(3) = 24(3) - 12(3)^2 < 0$$

$\therefore$  maximum at  $(3, 27)$ .

$\therefore$  horizontal point of inflexion at  $(0, 0)$  and maximum at  $(3, 27)$ .

State Mean:  
**3.01**

$$\begin{aligned} \text{(ii)} \quad y &= 4x^3 - x^4 \\ &= x^3(4 - x) = 0 \\ x &= 0, 4 \end{aligned}$$

State Mean:  
**1.44**
